Erin is a Lecturer in Biostatistics at the Sydney School of Public Health, University of Sydney. He is responsible for both the content and administration of this unit. One or more other biostatisticians from the School will be assisting with marking of assessments and responding to enquires made through eLearning throughout the semester.

Background
A sound understanding of the basic principles of statistical inference, including the theory of statistical estimation and hypothesis testing, is necessary for students to gain a deeper understanding of methods used in the design and analysis of biomedical and epidemiological studies. Specifically, it verses students in the language of uncertainty. An understanding of the theoretical bases and drawbacks of common biostatistical techniques is essential for practising biostatisticians to be able to assess the validity of these techniques for particular studies, and to be able to modify those techniques where appropriate. This unit of study (unit) provides the core prerequisite knowledge in statistical inference, which will subsequently be built upon in other units.

Unit summary
The unit will introduce and review core concepts of statistical inference, including estimation, hypothesis testing, Type I & II errors and p-values. The emphasis will be on the practical interpretation of these concepts in biostatistical contexts, including an emphasis on the difference between statistical and practical/clinical significance. The unit will provide a general study of the likelihood function, which will be used as a basis for the study of likelihood-based methodology, including maximum likelihood estimation and inference based on likelihood ratio, Wald, and score test procedures. The Bayesian approach to statistical inference will be briefly studied and contrasted with the classical frequentist approach. Further inference topics will also be introduced.
Workload requirements

The expected workload for this unit is 10-12 hours per week on average, consisting of textbook readings, discussion board posts, independent study and completion of assessment tasks.

Prerequisites

Mathematic Background for Biostatistics (MBB)
Probability and Distribution Theory (PDT)

PSI build extensively upon the material covered in Probability and Distribution Theory (PDT). You may find it useful to refer back to your PDT notes. The first two chapters and the appendix of the textbook contain information that will be helpful for PSI – it is strongly recommended that you read those chapters early in the semester and refer to the appendix as required throughout the unit.

Learning Outcomes

At the completion of this unit students should be able to:

1. Write a likelihood function
2. Derive and calculate the maximum likelihood estimate
3. Derive and calculate the expected information
4. Calculate and interpret p-values, power and CIs correctly
5. Derive a Wald test, Score test, and likelihood ratio test
6. Use a Bayesian approach to derive a posterior distribution
7. Calculate and interpret posterior probabilities and credible intervals
8. Apply and explain an exact method, non-parametric and sampling-based method

Unit content

The unit is divided into 6 modules, summarised in more detail below. Each module will involve approximately 2 weeks of study and generally includes the following material:

1. A chapter from the textbook, which includes statistical theory and an extended example illustrating the statistical theory covered.
2. A recorded lecture on the theory and a recorded lecture on the extended example.
3. A number of practical exercises, one of which is required to be submitted for assessment.
4. A discussion board which should be used to ask lots of questions and post up solutions to non-assessed exercises

With the exception of the textbook, study materials for all modules are downloadable from the eLearning (Canvas) unit site. Assignments and supplementary material, such as analysis datasets, will be posted to the unit site.
**Recommended approaches to study**

Students should begin each module by reading through the relevant chapter of the text and work through the extended example in parallel with the exercises. You are encouraged to post any content-related questions to eLearning, whether they relate directly to a given exercise, or are a request for clarification or further explanation of an area in the notes. You should also work through all of the computational examples in the notes for yourself on your own computer.

Solutions to the exercises in each module (except those to be submitted for assessment, as described below) will be posted online at the midway point of the allocated time period for the module. This is intended to encourage you to attempt the exercises independently before being given access to solutions.

Some of the exercises require computer simulations, and for these Stata code will be provided on eLearning. You are welcome to use any other software you have available and are familiar with for the exercises (e.g., R, SAS), however code will not be provided for these packages and assistance may not be available. Some exercises require the creation of graphs – these can be done in statistical software or a spreadsheet package (e.g., Excel) and must comply with the guidelines for reporting of statistical results found on the BCA website:

Although a nominal period of 14 days is allocated to work on each module, students can ask questions about the material in any of the modules at any time during the semester.

**Method of communication with coordinator**

The eLearning website is the primary forum for communication between co-ordinators and students. It will also be used for posting all course material. The timetable below shows the dates when assignments will be made available. Please check the website regularly for new material and to keep up-to-date with class discussions.

Please post content-related questions to the relevant Discussion forum in the PSI eLearning site. You should be familiar with the eLearning system from previous BCA units, and will receive any specific instructions on using the eLearning site this semester from the BCA Coordinating Office. There is also a “Getting Started” document available on the Student Resources page of the BCA website.

Questions about administrative aspects or course content can be emailed to the coordinator, and when doing so please use “PSI” in the Subject line of your email to assist in keeping track of our email messages. Coordinator/s will be available to answer questions related to the module content and practical exercises, and to address any other issues that require clarification. However, please note that instructors are not necessarily available every day of the week and you should expect that it may take a day or so to respond to questions (possibly longer over weekends, during breaks, and NSW public holidays).

For personal matters, please email or phone the unit of study coordinator.
Module descriptions

Below is an outline of the study modules, followed by a timetable and assessment description table. Each module of this unit corresponds to a chapter in unit textbook. Each module is scheduled to begin on a Monday and conclude on the Sunday of the following week. The due date for submission of the required exercises from each module is 11:59pm on the day immediately following the completion of the module, as indicated below.

Module 1: Likelihood (Chapter 3)
- Likelihood function
- Sufficiency
- Nuisance parameters
- Approximate likelihood

Module 2: Estimation Methods (Chapter 4)
- Maximum likelihood estimation
- Statistical information
- Properties of maximum likelihood estimation

Module 3: Hypothesis testing concepts (Chapter 5)
- Null and alternative hypotheses
- Test statistics
- P-values
- Type I and Type II errors, significance level, and power
- Statistical significance and practical importance

Module 4: Hypothesis testing methods (Chapter 6)
- Likelihood ratio tests
- Score tests
- Wald tests
- Relationship between the three tests
- Interval estimation based on the three tests

Module 5: Bayesian methods (Chapter 7)
- Basic concepts: subjective probability
- Bayes’ rule, prior and posterior distributions
- Conjugate and non-informative prior distributions
- Analysis of simple binomial and normal models

Module 6: Further inference methods (Chapter 8)
- Exact methods
- Non-parametric methods
- Bootstrapping and other resampling methods
## Unit schedule

Semester 2, 2019 starts on Monday 29th July.

## Assessment

Assessment will include 2 written assignments worth 40% each, to be made available in the middle and at the end of the semester, and to be completed within approximately two weeks. These assignments will be posted on the eLearning site together with an online Announcement broadcasting their availability. In addition, students will be required to submit solutions to selected practical exercises (one from each module), worth a total of 20%, by deadlines specified throughout the semester (see table above).

</tbody>
</table>

* Your best five modules from six will each contribute 4% each towards the total of 20% for the module exercises.

In general you are required to submit your work typed in Word or similar (e.g. using Microsoft's Equation Editor for algebraic work) and we strongly recommend that you become familiar with equation typesetting software such as this. If extensive algebraic work is involved you may submit neatly handwritten work, however please note that marks will potentially be lost if the solution cannot be understood by the markers due to unclear or illegible writing. This handwritten work should be scanned and collated into a single pdf file and submitted via the eLearning site. See the BCA Assessment Guide document for specific guidelines on acceptable standards for assessable work.

The instructors will generally avoid answering questions relating directly to the assessable material until after it has been submitted, but we encourage students to discuss the relevant parts of the notes among themselves, via eLearning. However explicit solutions to assessable exercises should not be posted for others to use, and each student's submitted work must be clearly their own, with anything derived from other students' discussion contributions clearly attributed to the source.

**Submission of assessments and academic honesty policy**

You should submit all your assessment material via eLearning unless otherwise advised. The use of Turnitin for submitting assessment items has been instigated within unit sites. For more detail please see pages 3-5 the BCA Student Assessment Guide.

The BCA pays great attention to academic honesty procedures. Please be sure to familiarise yourself with these procedures and policies at your university of enrolment. Links to these are available in the BCA Student Assessment Guide. When submitting assessments using Turnitin you will need to indicate your compliance with the plagiarism guidelines and policy at your university of enrolment before making the submission.
Late submission of assessments and extension procedure

The standard BCA policy for late penalties for submitted work is a 5% deduction from the earned mark for each day the assessment is late, up to a maximum of 10 days (including weekends and public holidays). Extensions are possible, but these need to be applied for (by email) as early as possible. The Unit Coordinator is not able to approve extensions beyond three days; for extensions beyond three days you need to apply to your home university, using their standard procedures.

Learning resources

The textbook for this unit is:

Marchner, I.C.

Inference Principles for Biostatisticians
Chapman and Hall / CRC, 2014
ISBN 9781482222234
http://www.crcpress.com/product/isbn/9781482222234

This book contains all of the material that will be covered in this unit of study. Note, that you may have digital access to this text through you home university library.

Other references books which you may find useful include:

Many statistical textbooks are not entirely devoted to inference, but have several sections on inference, which may not be as theoretical as the books above. Two of many are:

Software
The purpose of this unit is not to teach statistical computing. However, there are some exercises that rely on the use of simulation to help understand the concepts being taught.

The recommended and supported software for this unit is Stata. Whenever you will be required to use statistical software, the necessary code will be downloadable from the PSI eLearning website. The code can be run on your computer, and usually will only need to change input values for exercises/assignments. If you have not used Stata previously, it is highly recommended that you attempt to familiarise yourself with it prior to the beginning of semester.

Some students do struggle with the software. Please do not be afraid to ask for help from other students and instructors on Discussion Boards. Try not to allow any difficulties with software obscure the basis of the course, which to understand the principles of statistical inference. However, it is also important that practising biostatisticians can work in various software packages, so it is worthwhile making the effort to become proficient in at least one package.

Feedback
Our feedback to you:

The types of feedback you can expect to receive in this unit are:

- Formal individual feedback on submitted exercises/assignments
- Responses to questions posted on Discussion boards in eLearning

Your feedback to us:

One of the formal ways that students can provide feedback on teaching and their learning experience is through the BCA student evaluations at the end of each unit. The feedback is anonymous and provides the BCA with evidence of aspects that students are satisfied with and areas for improvement.
